Your business. Your goals.

Start with what matters. Keep your answers short and practical.

01 Your business

What do you do, who do you serve, and what do customers value?

02 Your priorities

What are the three things you most want to improve?

03 Your customers

What questions do customers ask most often?

04 A useful outcome

What would better look like: less admin, clearer communication, or something else?

Map what you already have.

Your people, knowledge and tools are the starting point.

01 People and responsibilities

Who does the work, who checks it and who can approve a change?

02 Business knowledge

Where do your product details, brand guidance, FAQs and procedures live?

03 Tools and channels

List your email, files, customer systems, website and marketing channels.

04 Access and sensitive information

What must remain private? Who is allowed to see or change each source?

Find the everyday friction.

Look for work that repeats, takes time or creates avoidable errors.

01 Repetitive tasks

List three tasks you keep doing or explaining. How often do they happen?

02 Inputs and outputs

For one task, what information goes in and what should come out?

03 Time and quality

How long does it take now? What makes an output useful and accurate?

04 Review and exceptions

What must a person check? When should AI stop and ask for help?

Choose a first step.

Pick one manageable task and define how you will judge the result.

01 Your first opportunity

Which task is worthwhile, frequent and supported by reliable information?

02 A simple workflow

Write the steps: source information > draft output > human review > next action.

03 Owner and boundaries

Who is responsible? What access, budget and approvals are needed?

04 A small trial

What will you test, what will you measure, and when will you review it?
